

We are creating Admin Tool that allows users to manage images. One of the key features provided by this tool, is the ability to add images with tooltips. The tooltips on the images are highlight customizable. Users should be able to customize the tooltips colour, text and position relative to the image. The complete admin view should include the follow:

- 1) see list of all images in a gridview
- 2) an add new image with tooltip view, linked off the gridview
- 2) when click on an image in the gridview, an image details view should appear that contains the one image + tooltip on hover;
- 3) an update selected image + tooltip text + tooltip position, linked from image details view
- 5) a remove image feature

Requirements:

- You should use one of the modern js frameworks;
- Markup should be simple but adaptive for mobile devices
- You should create custom functionality for handling tooltips on images, and not use already existing solutions
- Before implementing your solutions, provide an estimation and the list of technologies that you are going to use
- To save/load images you can use localStorage or 3rd-party services;

Bonus:

- emulate server interaction. All requests/responses have to be stubbed. It should be possible to unstub and change to real back-end.

Before you start, please provide a list of technologies you will use and an estimate (how long it will take you to complete the task).
